# ACSC/STAT 3720, Life Contingencies I <br> Winter 2015 <br> Toby Kenney <br> Modified version to deal with changes in schedule <br> Due: Monday 4th April: 12:30 PM 

## Basic Questions

1. A woman aged 36 , for whom the ultimate part of the lifetable in Table 1 is appropriate, buys a 10-year term insurance policy with a death benefit of $\$ 800,000$. (The policy uses a net annual premium.) Five years later, she wants to surrender the policy. The interest rate is $i=0.04$. If the insurance company pays a cash surrender value of $80 \%$ of the net policy value, how much does she receive?
2. An insurance company sells a 15 -year term insurance policy to a life aged 29 to whom the ultimate part of the lifetable in Table 1 applies. The death benefit is $\$ 180,000$ in the first two years, $\$ 160,000$ in the second to fifth year and $\$ 140,000$ for the remaining 10 years. The premiums are $\$ 96.85$ for the first three years, and $\$ 26.64$ for the remaining twelve years. The interest rate is $i=0.05$ for the first 4 years, and $i=0.07$ for the remaining 11 years. Calculate the retrospective policy value after 2 years.
3. A man aged 61 , who is a select life on Table 1 buys a 10 -year term insurance with a benefit of $\$ 700,000$. The interest rate is $i=0.04$, which gives $A_{[61]}=0.2979703, A_{[61]+1}=0.3085693$, $A_{64}=0.330027, A_{65}=0.340726$ and $A_{71}=0.409741$. Using a Full preliminary term of 1 year, calculate the policy value after 4 years.

## Standard Questions

4. An insurance company is valuing its policies. It finds that the total value of a large group of 200 policies was $\$ 1,100,000$. The total annual premium for all these policies is $\$ 96,000$. The interest rate is $i=0.06$. All of the policies have a mortality rate $q_{x}=0.00029$. 130 of the policies have death benefit $\$ 900,000$; 50 have death benefit $\$ 1,500,000$; and the remaining 20 have death benefit $\$ 1,300,000$. There are no expenses associated with the policies, and during the following year none of the policy holders dies. What is the total value of all the remaining policies the following year?
5. A man aged 38 , who is a select life on Table 1 buys a 10 -year annual term insurance policy with a death benefit of $\$ 500,000$. The interest rate is $i=0.06$, so $A_{[38]: \overline{10}]}^{1}=0.00396899$. The insurance company pays a cash surrender value of $85 \%$ of the policy value. If he is still a select life at age 45 , would he save money by surrendering his current policy and buying a new 3 -year policy for the same coverage?
6. A man bought a whole life insurance policy 6 years ago. At the time, his age was 42 , and his mortality followed the ultimate part of the lifetable in Table 1. The benefit of the policy was $\$ 800,000$. The interest rate is $i=0.06$. He now wants to convert the policy to a paid-up term policy with a term of 5 years. The insurance company offers a cash surrender value of $70 \%$ of
the policy value. What is the death benefit of the new insurance contract? $\left[A_{42}=0.0714153\right.$, $A_{48}=0.0969315$ and $A_{53}=0.124241$.]

Table 1: Select lifetable to be used for questions on this assignment

| $x$ | $l_{[x]}$ | $l_{[x]+1}$ | $l_{[x]+2}$ | $l_{[x]+3}$ | $x$ | $l_{[x]}$ | $l_{[x]+1}$ | $l_{[x]+2}$ | $l_{[x]+3}$ |
