# ACSC/STAT 3720, Life Contingencies I WINTER 2017 <br> Toby Kenney <br> Sample Final Examination 

This Sample examination has more questions than the actual final, in order to cover a wider range of questions. Estimated times are provided after each question to help your preparation. Assume lives are in the ultimate part of the model unless otherwise specified, and policies are annual unless otherwise specified. All questions use Table 1 unless otherwise specified. Values of $A_{x}$ for this lifetable have been calculated and are in Table 2.

1. For a life aged 32 , for whom Table 1 is appropriate, an insurance company provides a whole life insurance policy with annual premiums $\$ 3,803$ and death benefits of $\$ 600,000$. The interest rate is $i=0.03$. What is the probability that the policy makes a profit? [ 10 mins ]
2. An insurance company sells a 15 -year endowment policy to a life aged 47 . The policyholder can afford annual premiums of $\$ 1,400$. The interest rate is $i=0.04$. Calculate the death benefit that matches this premium under the equivalence principle. $\left[A_{47: \overline{15}}=0.558772\right.$.] [5 mins]
3. An insurance company sells a 10 -year term insurance policy to a life aged 51 . The death benefit is $\$ 750,000$. Calculate the net premium using the equivalence principle at an interest rate $i=0.06$. You are given $A_{51: \overline{10} \mid}^{1}=0.0128582$. [10 mins]
4. An insurance company sells a whole-life insurance policy to a life aged 39. The interest rate is $i=0.05$. The death benefit is $\$ 350,000$, and premiums are payable in advance until age 80. Calculate the annual net premium using the equivalence principle. [You calculate that $A_{39}=0.0905389$ and $A_{80}=0.457434$. ] [10 mins]
5. An insurance company sells a deferred annuity to a life aged 45. The interest rate is $i=0.05$. The policy pays an annual annuity of $\$ 40,000$, starting at age 65 . It is purchased with annual premiums from age 45 to age 65. Calculate the net annual premiums required. [ 10 mins ]
6. An insurance company sells a 10 -year term insurance policy to a life aged 42 . The interest rate is $i=0.06$. The death benefit is $\$ 200,000$. Initial expenses are $\$ 200$ plus $40 \%$ of the first premium. Renewal expenses are $2 \%$ of each subsequent premium. Calculate the annual premiums using the equivalence principle. [ 15 mins ]
7. An insurance company sells a deferred annuity to a life aged 33. The interest rate is $i=0.04$ and the annual annuity payment is $\$ 82,000$, starting from age 65 . The annuity is purchased with annual premiums until age 65. The initial expenses are $\$ 600$ plus $50 \%$ of the first premium, and renewal expenses are $2 \%$ of each premium during the deferred period, and $\$ 123$ each year while the annuity is being payed. Calculate the premium using the equivalence principle. [10 mins]
8. An insurance company issues a whole life insurance policy to a life aged 43 . The interest rate is $i=0.03$, and the death benefit is $\$ 380,000$. Net monthly premiums are payable until death. Calculate the monthly premium using
(a) The Uniform Distribution of Deaths assumption. [10 mins]
(b) Woolhouse's formula. [10 mins]
9. An insurance company issues a 10 -year endowment policy to a life aged 53 . The interest rate is $i=0.04$, and the benefit is $\$ 220,000$. Calculate the net monthly premium using
(a) The Uniform Distribution of Deaths assumption. [10 mins]
(b) Woolhouse's formula. [10 mins]
10. An insurance company sells 5000 whole-life insurance policies to lives aged 49. The interest rate is $i=0.03$. The policies have a death benefit of $\$ 700,000$. Use the portfolio percentile premium principle to calculate the net annual premium for these policies, so that the probability of a loss on the portfolio is 0.02 . [You may use a normal approximation for aggregate losses. ${ }^{2} A_{49}=0.099137$.] [30 mins]
11. An insurance company sells 3000 whole-life insurance policies to lives aged 55 . The interest rate is $i=0.05$. The policies have a death benefit of $\$ 200,000$. Use the portfolio percentile premium principle to calculate the net annual premium for these policies, so that the probability of a loss on the portfolio is 0.02 . [You may use a normal approximation for aggregate losses. ${ }^{2} A_{55}=0.0520745$.] [30 mins]
12. An insurance company sells 4000 10-year term insurance policies to lives aged 38 . The interest rate is $i=0.05$. The policies have a death benefit of $\$ 100,000$. Use the portfolio percentile premium principle to calculate the net annual premium for these policies, so that the probability of a loss on the portfolio is 0.02 . [You may use a normal approximation for aggregate losses. ${ }^{2} A_{38: \overline{10} \mid}=0.378046$.] [30 mins]
13. An insurance company sells a 10 -year term insurance policy to a life aged 42 . The interest rate is $i=0.04$. The life enjoys a number of dangerous hobbies, and so has mortality rate increased by 0.009569451 . The death benefit of this policy is $\$ 350,000$. Calculate the net annual premium for this policy. [10 mins]
14. An insurance company sells a 15 -year endowment policy to a life aged 47 . The death benefit is $\$ 240,000$. The interest rate is $i=0.04$. The net annual premium is $\$ 11,689.86$. Calculate the net policy value of this policy after 4 years, using a basis with interest rate $i=0.03$. [15 mins]
15. An insurance company sells a whole-life insurance policy to a life aged 39. The interest rate is $i=0.05$. The death benefit is $\$ 350,000$, and premiums are payable in advance until age 80. The annual net premium is therefore $\$ 1,780.71$. Calculate the policy value after 14 years, using the same policy value basis as the premium basis. [ 10 mins ]
16. An insurance company sells a deferred annuity to a life aged 33. The interest rate is $i=0.04$ and the annual annuity payment is $\$ 82,000$, starting from age 65 . The annuity is purchased with annual premiums of $\$ 21,870.68$ until age 65 . The initial expenses are $\$ 600$ plus $50 \%$ of the first premium, and renewal expenses are $2 \%$ of each premium during the deferred period, and $\$ 123$ each year while the annuity is being payed. Calculate the policy value after 7 years using the same basis as the premium basis. [10 mins]
17. An insurance company sells 100010 -year term insurance policies to lives aged 42 . The interest rate is $i=0.06$. The death benefit is $\$ 200,000$. Initial expenses are $\$ 200$ plus $40 \%$ of the first premium. Renewal expenses are $2 \%$ of each subsequent premium. The gross annual premium is calculated as $\$ 190.97$. In the first 3 years of the policy:

- The interest rate is $i=0.07$ in the first year of the policy; $i=0.05$ in the second year of the policy; $i=0.08$ in the third and fourth years of the policy; and $i=0.06$ in the fifth year.
- One policyholder dies in the first year. One policyholder dies in the third year. No other policyholders die.
- The total initial expenses for the policies are $\$ 240,000$.
- The total renewal expenses for the policies are calculated as $\$ 2,600$ at the start of each of years $2,3,4$ and 5 .

Calculate the total profit on these policies at the end of the first 3 years, and divide the profit between interest, mortality and expenses. [15 mins]
18. An insurance company sells 100010 -year term insurance policies to lives aged 42 . The interest rate is $i=0.06$. The death benefit is $\$ 200,000$. Initial expenses are $\$ 200$ plus $40 \%$ of the first premium. Renewal expenses are $2 \%$ of each subsequent premium. The gross annual premium is calculated as $\$ 190.97$. In the first 3 years of the policy:

- The interest rate is $i=0.07$ in the first year of the policy; $i=0.07$ in the second year of the policy; $i=0.05$ in the third year of the policy;
- One policyholder dies in the second year. No policyholders die in the first or third years.
- The total initial expenses for the policies are $\$ 260,000$.
- The total renewal expenses for the policies are calculated as $\$ 2,200$ at the start of each of years 2 and 3 .

Calculate the asset share of the remaining policies at the end of the first 3 years. [ 15 mins ]
19. An insurance company issues a whole life insurance policy to a life aged 43 . The interest rate is $i=0.03$, and the death benefit is $\$ 380,000$. Net monthly premiums are payable until death. Using Woolhouse's formula, you calculate the monthly premium is $\$ 306.38$.
(a) Calculate the policy value after 8 years 4 months. [ 10 mins ]
(b) Calculate the policy value after 8 years 3.4 months. [10 mins]
20. An insurance company issues a 10 -year endowment policy to a life aged 53 . The interest rate is $i=0.04$, and the benefit is $\$ 220,000$. Using the Uniform Distribution of Deaths assumption, you calculate the net monthly premium is $\$ 1,513.86$.
(a) Calculate the policy value after 4 years 7 months. [ 10 mins ]
(b) Calculate the policy value after 4 years 6.8 months. [ 10 mins ]
21. An insurance company wants to design a policy with continuous premiums so that the policy value is given by ${ }_{t} V=100 t(t-8)(t-15)$. The death benefits are $\$ 200,000$. The policy is sold to a life aged 46 , with mortality given by $\mu_{x}=0.0000012(1.097)^{x}$. Calculate the premiums as a function of time if force of interest is $\delta=0.024$. [10 mins]
22. An insurance company sells a 10-year endowment insurance policy with continuous premiums at a rate of $\$ 1700$ per year. The benefits are $\$ 200,000$. The policy is sold to a life aged 46 , with mortality given by $\mu_{x}=0.0000012(1.097)^{x}$. The company finds that the policy value is given by ${ }_{t} V=200000 \frac{\left(1-e^{-0.03 t}\right)}{1-e^{-0.3}}$. What force of interest are they using (as a function of time)? [10 mins]
23. An insurance company offers a 10 -year term policy with death benefit $\$ 600,000$ payable at the end of the year of death. If the interest rate is $i=0.05$. For a select individual aged 36 , the annual premium for this policy is $\$ 264.88$. The policy pays a cash surrender value of $85 \%$ of the policy value. After 4 years, the policyholder wants to reduce the annual premiums to $\$ 100$ for the remainder of the policy. Calculate the new death benefits for the policy. [10 mins]
24. An insurance company sells a whole-life insurance policy to a life aged 44 . The policy has a death benefit of $\$ 250,000$. The interest rate is $i=0.06$. The annual premium for this policy is $\$ 1,216.05$. The policy has a cash surrender value of $80 \%$ of the policy value. After 8 years, the man asks to change the terms of the policy so that he pays no premiums for the next two years, but pays increased premiums after that time, so that the benefits for the policy remain the same. Is this change permissable, and if so, what should the new premiums be after the two year break? [10 mins]
25. An insurance company offers a 20 -year endowment insurance policy with benefit $\$ 400,000$ to a life aged 45 . The interest rate is $i=0.04$. The annual premium for this policy is $\$ 13,208.28$. The policy pays a cash surrender value of $90 \%$ of the policy value. After 12 years, the policyholder wants to change the policy to a whole-life insurance policy with the same premiums and an increased death benefit. Calculate the new death benefit. [10 mins]
26. An insurance company sells a whole-life insurance policy to a life aged 44 . The policy has a death benefit of $\$ 450,000$. The interest rate is $i=0.07$. The annual premium for this policy is $\$ 1,779.91$. The policy has a cash surrender value of $85 \%$ of the policy value. After 11 years, the woman asks to convert the policy to a paid-up term policy with the same death benefits. Calculate the term of the policy after this modification. [15 mins]
(i) 13 years
(ii) 22 years
(iii) 26 years
(iv) 31 years
27. An insurance company offers a whole-life insurance policy with annual premiums, in which the death benefits for a given year are equal to $\$ 100,000$ plus the policy value at the start of the year. The annual premiums for this policy are $\$ 881.11$. Calculate the policy value after 3 years. [15 mins]
28. An insurance company sells a 15 -year term insurance policy to a life aged 29 . The death benefit is $\$ 180,000$ in the first two years, $\$ 160,000$ in the second to fifth year and $\$ 140,000$ for the remaining 10 years. The premiums are $\$ 96.85$ for the first three years, and $\$ 26.64$ for the remaining twelve years. The interest rate is $i=0.05$ for the first 4 years, and $i=0.07$ for the remaining 11 years. Calculate the retrospective policy value after 2 years. [ 10 mins ]
29. A man aged 42 buys a whole-life insurance policy with a death benefit of $\$ 400,000$. The interest rate is $i=0.06$. The annual premium for this policy is therefore $\$ 1741.31$. Using a full preliminary term of 1 year, calculate the policy value of this policy after 4 years. [10 mins]
30. A man aged 34 buys a 25 -year endowment insurance policy with a benefit of $\$ 500,000$. The interest rate is $i=0.05$. The annual premium for this policy is therefore $\$ 10,162.60$. Using a full preliminary term of 2 years, calculate the policy value of this policy after 13 years. [10 mins]

Table 1: Select lifetable to be used for questions on this practice final

| $x$ | $l_{[x]}$ | $l_{[x]+1}$ | $l_{[x]+2}$ | $l_{[x]+3}$ |
